Exploring Chat GPT.

Open AI has recently developed a chatbot based on top of their OpenAI's GPT – 3.5 (**Generative Pre-Trained Transformer**) family language technology model. This uses supervised and reinforced learning techniques.

This generative AI has been developed to generate text which are similar to us writing texts as per our knowledge, giving you a feeling as if you have been conversing with a real person.

In simple language one can understand with an example that I normally give is going back to childhood days.

In Examination Hall we used to answer questions. In a similar fashion Chat Gpt answers your queries.

In Chat Gpt you typing a query, you should get a response which will have several sentences or paragraphs.

This is new development in the field of automatic text generation.

Q. How does OpenAI's chatbot API function?

The OpenAI Chatbot API is a cloud-based service that uses advanced natural language processing algorithms to enable chatbots to understand and respond to user input in a human-like manner.

When a user interacts with a chatbot that is powered by the Chatbot API, the user's input is sent to the API as a text message. The API processes the message, attempting to understand the user's intent and generate a suitable response.

The Chatbot API uses a combination of machine learning and artificial intelligence techniques to understand and generate text.

It has been trained on a large dataset of human conversation, so it can understand a wide range of inputs and generate responses that are appropriate and engaging.
